WHOLESALE OF OLIVE OIL

Olive oil, the most iconic food of Mediterranean diet, is known for its beneficial effects against heart diseases.

Virgin olive oil is a 100% natural product, with exceptional organoleptic characteristics (smell, color, taste). It is the only vegetable oil that can be used without being refined, which allows to keep all its content in vitamins, fat acids and other components of great dietetic importance, such as natural antioxidants (Vitamin E and polyphenols)

The origins of the olive tree farming are in the coasts of Syria, Lebanon and Israel more than 4000 years ago.

The Phoenicians introduced olive tree in 1050 BC. In the Roman Empire and later with the Arab domination cultivation and extraction techniques were improved and new culinary uses many Spanish words related to olive oil are from this period (aceite, almazara, alpechín, etc).

Now a days, although the discovery of America extended the area of cultivation, production structure is similar to its Mediterranean origins. The European Union is the largest world producer of olive oil with 80% share.

International Trade

WHOLESALE OF OLIVE OIL

VIRGIN OLIVE OIL

Is the juice of healthy olives, harvested at the optimum moment when olives are ripe and with an adequate production process.

When it is obtained from a single olive type is called "monovarietal" (sigletype), if a mix of types of olives are used in order to obtain a special taste and aroma is called coupage. Olive oils with Protected Geographical Status are those that have differentiated characteristics due to the geographical environment, types of olives, production process and with a quality controlled by its Control Board.

The objective is to promote diversification of production and protection against abuse of the Protected Geographical Status denomination.

There are 20 Protected Geographical Status areas in Spain 12 of them are registered in the European Union Registry, the other 8 are in the process of doing so.

The Protected Geographical Status areas are the following:

WHOLESALE OF OLIVE OIL

- “Extra olive virgin oil”, is the top quality, with no organoleptic defects and acidity equal or lower than 0.8°.
- “Virgin olive oil” good quality with traces of organoleptic defects and acidity equal or lower than 2°.
- If a virgin olive oil has chemical, physical or organoleptic defects it cannot be distributed directly, it has to be refined or used to add to refined olive oils. Olive virgin oil called “lampante” is exclusively used to be refined because of characteristics of defects that make it not suitable for consumption
- Refined olive oil; the nutritional value is lower than that of the virgin olive oil as the refining process eliminates vitamins and other components. The commercial denominations are:

International Trade

WHOLESALE OF OLIVE OIL

- "Olive oil" made of refined olive oil and virgin olive oil suitable for consumption in a variable proportion. Acidity is equal or below 1°.
- "Orujo olive oil" made with refined olive waste oil and virgin olive oil suitable for consumption. Maximum acidity 1°.

Health benefits

Olive oil has many beneficial effects:

- Helps to protect oesophagus mucosa from the acids in the stomach and improves the digestive process and the absorption of nutrients in the intestine.
- Helps to prevent the risk of heart diseases as it reduces the total cholesterol levels and the LDL or "bad" cholesterol maintaining or increasing the HDL or "good" cholesterol.
- Improves metabolic control of diabetes.

DISTRIBUTION AND WHOLESALE RICE

There are many rice types which are differentiated by the individual characteristics of each of them, each type is suitable for differentiated recipes.

Rice can be long and thin, glutinous, wholemeal, from Thailand or Basmati... There are over 2.000 varieties of rice in the world although many of them are not commercially cultivated.

Most of rice types have been originated from two wild species, the *Oriza sativa* from Himalaya and *Oriza glaberrima*, from the Niger Delta.

According to grain size, rice can be classified in different types: long, medium and short or round grain. The first one is over 6 millimeters long light and very dry and free flowing as opposed rather than sticky, that is why is widely used as ingredient in salads. Within this group we find among many others, the aromatic Basmati of India and Pakistan, rice from Thailand with its jazmin touch, Ferranini of Italy and Bond rice from America. In Spain we have the Urumati rice an aromatic long grain variety, used in oriental food recipes.

Medium size grain is between 5 and 6 millimetres long and is shorter and more barreled in shape than the long grain varieties. Its flavour is smoother and it has a more tender texture. Short grain rice is almost as long as it is wide (4 to 5 millimeters long by 2,5 millimeters wide).

The Arborio rice is the best known variety of medium size grain, the Spanish varieties of Jucar, or the Bomb rice are short grain varieties. Another short grain variety is glutinous rice, with high percentage of starch which causes the grain to stick together after it is cooked. It is frequently used to cook risottos.

International Trade

DISTRIBUTION AND WHOLESALE RICE

Summary of the main rice varieties and its uses:

- Glutinous rice, after boiling it sticks together due to its high content of starch. Ideal for Japanese sushi.
- Long grain rice, grain size over 6mm; it cooks quickly with free flow grains. Ideal for salads, plain rice and as a side plate.
- Medium size grain, (5 to 6 mm) is the most widely used. Good for "paellas", rice cooked in oven, or rice soups.
- Parboiled rice, it does not overcook or stick due to its special treatment. It does not absorb flavour of other ingredients as easily as other types. It is necessary to increase the liquid, time and settling. Ideal for rice soups.
- Round grain rice, it is small in size, cooks quickly, high starch content. Ideal for risottos and rice pudding.
- Wild rice or Indian rice, it is not a rice properly, is dark in color. Ideal for decorating and as a side order.
- Basmati rice, long and thin grain, grains do not break during cooking and they do not stick together. Ideal as a side order and for curry and oriental recipes.

International Trade

DISTRIBUTION AND WHOLESALE RICE

- Brown rice: Dark because because is only partly milled rice. Rich in vitamins. Requires long boiling time (45 minutes) ideal for diets and vegetarian cooking.
- Thai rice: Jazmin aroma. Ideal for fish and shellfish.

DISTRIBUTION AND WHOLESALE RICE

TYPES

The main types of rice are: white rice, long grain rice which is totally milled. Its quality is worldwide appreciated and it is the type which is mostly produced in Spain. When cooked grains tend to stay free. Another type is the brown rice which keeps the inner layers surrounding the grain (bran layer and the germ) which are removed in white rice. It has higher fiber content than other types of rice which is noticeable when it is chewed. Similar to brown rice is parboiled rice which has the same nutritional value and a similar brownish color that turns white when cooked. Before distribution, it undergoes a special process which makes the rice free flowing and makes it more difficult to overcook or stick and it is very nutritious although it takes more time to cook.

There is also the Vermelho or red rice, from Asia, its name comes from the color of the layer surrounding the grain. It grows in low fertility soils or mountain areas and is normally ground to obtain a white flour. Finally there is the black rice, also from Asia, rich in vitamin B and dietary minerals. This type is grown in China, Bali, Thailand, and its main characteristic is a thin black layer surrounding a white grain.

Wholesale of sugar I CUMSA

The process of sugar manufacturing can be split in the following stages:

Harvest.

Chopping and harvesting of sugar cane

Storage.

Sugar cane is sorted by quality according to saccharose content, fibre and impurities. Sugar cane is weighted and rinsed.

Crushin of sugar cane.

Sugar cane is crushed in machines specially designed to obtain small lumps Milling.

Applying pressure, juice is extracted from sugar cane. Hot water is added to extract the maximum saccharose contained in the fiber.

Refining.

In this process the temperature of the juice is increased and a light juice separates from the rest. It is possible to refine the light juice by adding lime stone that help to separate insolubles compounds. It is also treated with gaseous sulphur dioxide as a whitening agent although not all white sugars come from a refining process.

International Trade

Wholesale of sugar | CUMSA

Vaporization.

Water is vaporized from the juice to obtain a syrup with a concentration of solids between 55% and 60%. The syrup is purified in a clarifier, the process is similar to the one used to refine the filtered juice.

Crystallization.

The process produces sugar crystals and liquid.

Spinning.

Sugar crystals are separated from the liquid.

Drying and cooling.

Damp sugar is dried in driers of hot air and then passed through cold air coolers.

Packing.

Dry and cold sugar is packed in bags and is ready for sale.
